

1 **ABSTRACT**

2 In accordance with certain aspects of the present invention, improved
3 methods and arrangements are provided that improve access control within a
4 computer. The methods and arrangements specifically identify the authentication
5 mechanism/mechanisms, and/or characteristics thereof, that were used in verifying
6 that a user with a unique name is the actual user that the name implies, to
7 subsequently operating security mechanisms. Thus, differentiating user requests
8 based on this additional information provides additional control.
